

MotoSTUDENT

MotoStudent is an international competition in which universities from around the world compete by designing, developing, and manufacturing a racing motorcycle from the ground up.

The event takes place at the MotorLand Aragón circuit and assesses both the technical and business aspects of the project.

The competition is divided into two main categories:

Static tests

- Engineering and design
- Business plan
- Cost analysis

Dynamic tests

- Acceleration
- Top speed
- Handling
- Endurance
- Energy efficiency

The objective is to develop a competitive, efficient, and innovative motorcycle capable of performing under real track conditions.

OUR TEAM

Chassis development, mechanical systems engineering, and aerodynamic analysis to maximize on-track efficiency.

Development and integration of the electric propulsion system, ensuring robust power delivery, high efficiency, and reliable energy performance.

Design of the electronic architecture and signal acquisition, ensuring seamless communication between systems and the reliable operation of the prototype.

In-depth analysis and handling of information to achieve peak vehicle performance.

Preparation of technical reports, corporate documentation, and comprehensive business plans.

OBJECTIVE: Develop professionals with distinctive strengths

2015

Establishment of the team marked by the creation of a pioneering petroleum prototype

2017 IMSP-01

2018

The team initiates the challenge of moving from an ICE to an electric engine. Both petrol and electric prototypes are made.

2019 IMSP-02

We decide to focus only on electric powered motorcycles abandoning petrol and developing our maiden IMS-01

2023 IMSE-02

Competition took place at both Jarama and Motorland, achieving strong results and reducing the motorcycle's weight.

2022

2021 IMSE-01

The first time our prototype gets through all the tests, obtaining notorious results especially in the brake test

2020

Despite not competing, the arrival of the pandemic posed a challenge for the work methodology. Our adaptation was such that the work rhythm was not interrupted

2024

2025 IMSE-03

Major technical advances were achieved compared to the previous edition, especially in the mechanical area.

2026

Reasons to join the project

It offers a rare chance to apply theoretical knowledge in a real engineering environment, contributing to the design and development of a competition motorcycle from the ground up. Team members gain hands-on experience across technical and organisational areas, tackling real challenges, tight deadlines and key decision-making in a multidisciplinary setting.

The project also strengthens essential skills such as teamwork, innovation and adaptability, preparing students for their future careers in the industry. Being part of this team means more than building a motorcycle; it means joining an experience that drives talent, ambition and personal growth.

What do we need to grow?

1

1. Human Capital

An unwavering team of over 80 students: a collective of burgeoning talent dedicating their discretionary time, fervor, and tireless efforts to the fruition of this project.

2

2. Expertise

Our cohorts span from second-year undergraduates to first-year master's candidates. These past seven seasons have yielded unparalleled learning milestones, fostering a culture of continuous academic and practical growth.

3

3. Resources

Our endeavors would be rendered impossible were it not for the steadfast support of our sponsors.

While a formidable team and extensive experience are fundamental, it is the provision of high-caliber resources that empowers us to push the boundaries of innovation and excellence.
